

Test #7 of Erlang

Christian Rinderknecht

7 October 2011

1. Write a function `flen` (*flat length*) such that, if

$$\text{flen}(P) \xrightarrow{+} N,$$

then N is the number of non-list items in list P . For instance,

$$\text{flen}([a, [], [0, [[b]], [], 1]]) \xrightarrow{+} 4,$$

$$\text{flen}([[], [], [], []]) \xrightarrow{+} 0,$$

$$\text{flen}([]) \xrightarrow{+} 0.$$

2. Write a function `enc/1` (*encode*) such that, if

$$\text{enc}(P) \xrightarrow{+} Q,$$

then Q is the list of pairs made of each item of P and their number of consecutively repeated items. For instance,

$$\text{enc}([a, a, b, c, c, c, a]) \xrightarrow{+} [\{a, 2\}, \{b, 1\}, \{c, 3\}, \{a, 1\}],$$

$$\text{enc}([a, b]) \xrightarrow{+} [\{a, 1\}, \{b, 1\}].$$

3. Improve upon `enc/1` in such a way that item not repeated appear in the result as themselves. For instance,

$$\text{enc}([a, a, b, c, c, c, a]) \xrightarrow{+} [\{a, 2\}, b, \{c, 3\}, a],$$

$$\text{enc}([a, b]) \xrightarrow{+} [a, b].$$
