

Test #6 of Erlang

Christian Rinderknecht

7 October 2011

1. Write a function `suf/2` (*suffix*) such that, if

$$\text{suf}(P, Q) \xrightarrow{+} R,$$

and list P is the ending of list Q then R is `true`, otherwise `false`. For example,

$$\text{suf}([1, 1, 0, 0], [0, 1, 1, 0, 1, 1, 1, 0, 0]) \xrightarrow{+} \text{true},$$

$$\text{suf}([c, i, t, y], [a, t, r, o, c, i, t, y]) \xrightarrow{+} \text{true},$$

$$\text{suf}([2], [5, a], [4, a]) \xrightarrow{+} \text{false},$$

$$\text{suf}([], [1, 2, 3]) \xrightarrow{+} \text{true}.$$

Note that the empty list is the suffix of *any* list.

2. Write a function `allp/1` (*all prefixes*) such that, if

$$\text{allp}(P) \xrightarrow{+} Q,$$

then Q is the list of all the prefixes of P , by increasing length. A prefix is a list whose items are found in the beginning of another list. For example,

$$\text{allp}([1, 2, 3, 4]) \xrightarrow{+} [[1], [1, 2], [1, 2, 3], [1, 2, 3, 4]].$$
