

Quiz of Information Retrieval

Christian Rinderknecht

1st December 2005

1. Give a version of the naive search algorithm where the word slides from left to right and the comparisons between the word letters and the text letters are made from right to left.
2. (a) Give an algorithm such that the input is a deterministic finite automaton and the output is the set of states which are unreachable from the initial state.
(b) Apply this algorithm to the following DFA.

	<i>a</i>	<i>b</i>
<i>E</i>	<i>D</i>	<i>C</i>
<i>D</i>		<i>C</i>
<i>#F</i>	<i>F</i>	
<i>→ C</i>	<i>D</i>	<i>F</i>

3. Give a deterministic finite automaton which recognises the same language as the following non-deterministic finite automaton.
