

Homework of Erlang

Christian Rinderknecht

18 April 2007

1. Write a function `drop/2` such that `drop(L,N)` is the list `L` without every `N`th elements (first element is 1). For example

```
1> homework:drop([1,2,3,4,5,6,7,8,9],3).  
[1,2,4,5,7,8]
```

2. Write a function `rnd_select/2` such that `rnd_select(L,N)` is a list of `N` items selected pseudo-randomly from the list `L`. For instance

```
1> homework:rnd_select([2,[],4,[[5],6],1,-2,[3,[]]],3).  
[-2,[[5],6],2]  
2> homework:rnd_select([2,[],4,[[5],6],1,-2,[3,[]]],3).  
[[],[[5],6],[3,[]]]  
3> homework:rnd_select([2,[],4,[[5],6],1,-2,[3,[]]],3).  
[[[5],6],[3,[]],1]  
4>
```

Hint: Use `random:uniform/1`, since `random:uniform(P)` is an integer chosen pseudo-randomly by the **Erlang** runtime between 1 and `P`. (The distribution is uniform, that is, all numbers in the interval have an equal chance to be chosen.)

Try to make your functions as efficient as possible.
